

## Training register

Workplace register is a module of the application ID system.

It uses people identification by a contactless card or by a chip. The module provides an overview of operator training for working on workplaces of a production line.

A list of approved operators is registered for each document. Operator's levels are marked by different colors.

An overview of managed documents is available for each operator.

The screenshots illustrate the software's functionality. The top window displays a list of operations (e.g., 'montáž na rám', 'montáž kabeláže') with associated dates and revision numbers. The middle window shows a list of operators (e.g., 'Růžek Lukáš', 'Paňouka Tomáš') with their respective IDs and levels. The bottom window provides a detailed view of an operator's profile, including a photo, name, and a list of documents they are currently working on, such as 'Spovězení potahu předního sedáku' and 'Příprava samostatného sedáku'.

The system can be integrated with an application OMS Admin (Operational Method Sheets register), which can generate a requirement for a new training when the new revision is approved.

## Application output

ID System is able to export a matrix of documents managed by operators.

## Training register

After a setting of a new level of a document management, an announcement of the training is issued by the system.

An operator puts his signature on it by a reading of his ID card on a terminal.

A login to a workplace can be conditioned by a managing of a needed document.

### Report 1/3 for employees: Petr Dvořák

16.3.2015

I was trained in "Quality measurement, Signs of product quality", training category, training Nr. 005.

I attended the training, listened a lecture, understood the content and I will follow provided instructions.
